Detailed specifications of the required item(s):-

TREATMENT PROCESS

This **Sewage Treatment Plant** should be specifically designed for the purpose of treatment of Veterinary Hospital Waste Water Discharge before its disposal to bring the characteristics of the same upto acceptable norms and standards.

Water which is stored in the **Equalization Tank** is then lifted to **OIL & GREASE TRAP**, where Oil & grease particles are separated from stream. Then Waste water fed to **MBBR** by gravity, where Bacteria Culture develops on floating Media having high surface Area in attached form. This Bacteria derives its food from the organic impurities in water and air from the **Blower** which diffuses air in Fine Bubble Form at the bottom of the reactor through **Diffusers**. This reduces the BOD Load of the Discharge significantly.

Water from here is fed to a Highly Efficient **Tube Settler** by gravity where finer suspended impurities as well as dead organic matter from the SAFF Reactor is settled and dumped to Sludge Drying Beds by gravity.

Water which is then stored in **Pre-Filtration Sump** is pumped to a **Multi Grade Filter**. It removes very fine suspended particles in the Discharge Stream, as well as traces of any impurity or any odour or colour inherent in the stream. BOD and COD of water is further reduced during Filtration. A Slight dose of **Chlorine** is also added before filtration for disinfecting the water.
